

E3- Real Time Traveler Information, \$

(Hyperlink to ITSP Alternatives & Cost Estimates, click above link)

Project Description:

This project would create a real time information system to inform commuters about the availability and cost of parking in the city of Aspen and other locations along the SH82 corridor. This system will also give users real time information regarding the travel time difference between private vehicles and transit, to help travelers make more informed decisions about where to park and what mode to use.

This information would be conveyed to the public via real time message boards, the existing next bus system and mobile phone applications.

This project relates to other proposed projects, such as RFTA mobile website improvements, and the installation of information kiosks to make using, accessing, and getting information about the public transit in the region more intuitive.

Project Cost Estimate:

\$2,702,423 plus \$6,800 annual O&M

Special Considerations:

The implementation of this project and the majority of its expense are IT related hardware and software with a dispersed set of construction projects to install message board, kiosks, and real time signage.
